Sequence 8, Application US/08356405
Patent No. 5807691
GENERAL INFORMATION:
APPLICANT: Amlaiky, No. 5807691rdine
APPLICANT: Henselve, Ursula
APPLICANT: Henselve, Jean-Luc
TITLE OF INVENTION: Polypeptides Having Serotonin Receptor
TITLE OF INVENTION: Activity (5HT5A), Nucleic Acids Coding for TITLE OF INVENTION: Polypeptides and Uses Thereof
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        24;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 1073;

WPI; 2002-188744/24. N-PSDB; AAD29681. New human G-protein coupled receptor polypeptide for diagnosis, prevention and treatment of cell proliferative, neurological, cardiovascular, gastrointestinal, autoimmune/inflammatory, and metabolic disorders

Claim 1; Page 133-134; 150pp; English.

The invention relates to novel human G-protein coupled receptors (GCREC) and their encoding polynucleotides. GCREC is useful as an immunogen for preparing monochonal and polyclonal antibodies. GCREC is useful for diagnosing, treating and perventing a cell proliferative disorder (e.g., epilepsy, classase, provided and social disorder (e.g., epilepsy, populatis, psoriasis, cancer), a neurological disorder (e.g., epilepsy, classase), a cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), gastrointestinal disorder (e.g., gastritis, clarrosis, cornel and fasease), an autoimmune/ inflammatory disorder (e.g., cirrhosis, anthonic an autoimmune/ inflammatory disorder (e.g., diabetes, obesity, categorosis), and viral infections. GCREC is useful in a number of drug screening techniques, and to analyse the proteome of a tissue or cell type. GCREC is useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or germline gene therapy, to generate a transcript image of a tissue or cell type. GCREC is useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or germline gene creating differences in the chromosomal location due to translocation, inversion, etc., among normal, carrier or affected individuals, and as thybridization probes for mapping naturally occurring genomic sequences. GCREC is useful in Southern or northern analysis, dot blot or other membrane-based technologies, in PCR technologies, in dipstick, pin, multiformat enzyme linked immunosorbant (ELISA)-like assays, and in

New G protein-coupled receptor related polypeptides and polymucleotides for diagnosis, prevention and treatment of metabolic, neurodegenerative, retinal, immune, hematopoietic disorders, diabetes, obesity and

2001-626379/72.

P-PSDB; AAM47212

The present invention provides the protein and coding sequences of novel human G-protein coupled receptors, designated NOV1, NOV2, NOV3, NOV4,

Claim 8; Page 46; 194pp; English

infections,

٠,
ز
NOV5a, NOV5b, NOV6a, NOV6b, NOV7, NOV8a, NOV8b, NOV9 and NOV10. These can be used in the treatment of NOVX related diseases, including cancer, metabolic, neurodegenerative, immune, haematopoietic, developmental, retinal, feeding, neurological and psychotic diseases and disorders and infections. The present sequence is the NOV5b coding sequence, the gene for which is found on chromosome 2. The NOV5b protein shares homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          240

The present invention describes novel human proteins designated NOVX (where X is 1, 2a, 2b, 2c, 2d, 3, 4, 5, 6a, 6b, 7, 8, or 9). NOV1 is a tyrosine-protein kinase 6-like protein; NOV24 dare keratin 4-like protein; NOV35 is a collagen-like protein; NOV4 is a cystatin B-like protein; NOV8 is a centonin receptor-like protein; NOV65 vare cold inducible glycoprotein 30-like protein; NOV9 is a matrilin-2-like protein; NOV9 is a leukocyte surface antigen (CD53)-like protein; and cold inducible glycoprotein 30-like protein; NOV9 is a tyrosine kinase-like protein; NOV9 is a tyrosine kinase-like protein; NOV9 is a percentic, cardiovascular, antidiabetic, immunosuppressive and conting contective activities, and can be used in gene therapy. The NOVX sequences can be used in therapeutics, particularly for treating, sequences can be used in therapeutics, particularly a human. These disorders include cardiomyopathy, atherosclerosis, a disorder related to cell signal processing and metabolic pathway modulation or diabetes. The NOVX sequences are also useful for determining the presence of or predisposition to a disease associated with altered levels of NOVX predisposition to a disease associated with altered levels of NOVX predisposition in their papeutic or prophylactic applications for coll particularly encorer. The NOVX sequences are negotated in the treatment of feature in the presence of the particularly cancer. The NOVX sequences are negotated in the presence of or coll particularly and the treatment of feature in the presence of the particularly and in the presence of the particularly cancer. The NOVX sequences are necessarially useful in therapeutic or prophylactic applications for the presence of the particular in the presence of the particular and in the particular and the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            adenocarcinoma, lymphoma, prostate cancer, uterus cancer, immune response, AIDS, asthma, Crohn's disease, multiple sclerosis or Graft versus host disease. The present sequence encodes the human NOV5 protein from the present invention. NOV5 is located to chromosome 2

The invention relates to novel human G-protein coupled receptors (GCREC) and their encoding polynucleotides. GCREC is useful as an immunogen for preparing monoclonal and polyclonal antibodies. GCREC is useful for diagnosing, treating and polyclonal antibodies. GCREC is useful for diagnosing, treating and polyclonal antibodies. GCREC is useful for hepatitis, psoriasis, cancer), a neurological disorder (e.g., palepssy, Alzheimer's disease, Pick's disease, Huntington's disease, Parkinson's disease), a cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infaarction), gastrointestinal disorder (e.g., gastritis, cirrhosis, Crohn's disease), an autoimmune/ inflammatory disorder (e.g., acquired immunodeficiency syndrome (AIDS), allergy, anaemia, asthmator, rheumatoid arthritis), a metabolic disorder (e.g., diabetes, obesity, osteoporosis), and viral infactions. GCREC is useful in a number of drug screening techniques, and to analyse the proteome of a tissue or cell type. GCREC is useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or germline gene therapy, to generate a transcript image of a tissue or cell type, for detecting differences in the chromosomal location due to translocation,
                                                                                                                                                      New human G-protein coupled receptor polypeptide for diagnosis, prevention and treatment of cell proliferative, neurological, cardiovascular, gastrointestinal, autoimmune/inflammatory, and metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              microarrays utilising fluids or tissues from patients to detect altered GCRBC expression. The present sequence is human GCRBC-15 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inversion, etc., among normal, carrier or affected individuals, and as hybridization probes for mapping naturally occurring genomic sequences. GCREC is useful in Southern or northern analysis, dot blot or other membrane-based technologies, in PCR technologies, in dipstick, pin, multiformat enzyme linked immunosorbant (ELISA)-like assays, and in

The invention relates to isolated human G-protein coupled receptor (GCREC) polypeptides and their biologically active fragments. GCREC and protein is useful in treating a disease or condition associated with an increase or decrease in expression of functional GCREC. The GCREC's are useful in the diagnosis, treatment and prevention of cell proliferative disorders (cancer, leukaemia, melanoma); neurological disorders (stroke, epilepsy, Parkinson's disease, dementia, Alzheimer's disease); autoimmune inflammatory disorder (thyroiditis, haemolytic anaemia, AlDS, multiple sclerosis); cardiovascular disorder (atherosclerosis, angina pectoris), gastrointestinal disorder (ulcer, cholelithiasis, gastroenteritis), metabolic disorders (diabetes); viral infections (herpes virus) and in the assessment of the effects of exogenous compounds on the expression of the nucleic acid and amino acid sequences. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated human G-protein coupled receptor polypeptides and the use of these sequences in the diagnosis, treatment and prevention of diseases and in the assessment of exogenous compounds on the expression of the
